Halt the hands of time

Posted Tuesday, October 06, 2009

Peptides, GABA, hyaluronic acid, collagen, enzymes: these are the kinds of ingredients you'd expect in advanced anti-aging care for your face. But what about your hands? Being that they show age almost as obviously as that pretty punim of yours, don't they deserve the same kind of care.

Dermelect seems to think so, which is why they've included the most potent, proven components in their new **Timeless Anti-Aging Daily Hand Treatment**. Sure, it moisturizes like an everyday hand cream, but that wouldn't be enough to truly trounce the signs of aging.

While its hyaluronic acid takes care of the hydrating duties, a keratin peptide calls ProSina strengthens and softens skin with the help of collagen. GABA

makes an additional anti-aging impact by relaxing the muscles that lead to lines.

Because discoloration is one of the biggest hand hurdles, Timeless employs several ingredients to lessen its look, including bearberry-derived arbutin, ayurvedic emblica (which also has antioxidant properties), and licorice. Papaya ups the effect by exfoliating gently.

Despite all of this sophisticate skin improvement, the formula goes on comfortably, subtly improving your hands with each application.
